Rice blast is one of the most devestating fungal diseases
of rice world wide. It is a filamentous ascomycete with
a haploid genome (n=7) of approximately 40 Mbp. Rice
blast is an important model fungal pathogen for studying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /organism="Magnaporthe grisea"

/note="Vector: pBlueScript SK(-); Site_1: Econt; Site_2:
xhol; supplier: Glovannoni; Fruit were tagged at the
breaker stage (first sign of lycopene accumulation on the
blossom end of the fruit) and harvested 7 days
post-breaker (fully red-ripe), 10 days post breaker, and
20 days post-breaker (over-ripe). 20 day fruit which
showed external or internal signs of pathogenesis were
discarded. Fruit were cut in half and the seeds and
locules were discarded prior to freezing the pericarp."

Title: Perfect score: US-09-590-375-2 2713 1 HHNGTNGTMMQYFE

Sequence: HHNGTNGTMMQYFEWHLPND.....ADGWGNFTVNGGAVSVWVKQ 485

Searched: 100059 seqs, 36664827 residues Gapop 10.0 , Gapext 0.5

Scoring table:

BLOSUM62

Total number of hits satisfying chosen parameters:

100059

Minimum DB seq length: 0
Maximum DB seq length: 2000000000

Post-processing: Minimum Match 0%
Maximum Match 100%
Listing first 45 summaries

Database : SwissProt_39:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Submitted (MAR-1993) to the EMBL/GenBank/DDBJ databases.

-!- CATALYTIC ACTIVITY: ENDOHYDROLYSIS OF 1,4-ALPHA-GLUCOSIDIC

LINKAGES IN OLIGOSACCHARIDES AND POLYSACCHARIDES.

-!- SUBCLIULAR LOCATION: CYTOPLASMIC.

-!- SIMILARITY: BELONGS TO FAMILY 13 OF GLYCOSYL HYDROLASES, ALSO

KNOWN AS THE ALPHA-AMYLASE FAMILY.

                                                                                                                                                         CATALYTIC ACTIVITY: HYDROLYSIS OF 1,4-ALPHA-GLUCOSIDIC LINKAGES IN POLYSACCHARIDES SO AS TO REMOVE SUCCESSIVE MALTOSE UNITS FROM THE NON-REDUCING ENDS OF THE CHAINS.
                      polymyxa beta-amylase.";
Biochmistry 30:4594-4599(1991).
-!- FUNCTION: THE PRECUESOR PROTEIN IS PROTEOLITICALLY CLEAVED TO
PRODUCE MULTIFORM BETA-AMYLASES AND A 48 KDA ALPHA-AMYLASE AFTER
                                                                                                                                                                                                                                  -: CATALYTIC ACTIVITY: ENDOHYDROLYSIS OF 1.4-ALPHA-GLUCOSIDIC LINKAGES IN OLIGOSACCHARIDES AND POLYASACCHARIDES.
-: SUBCELLULAR LOCATION: SECRETED.
-: SIMILARITY: IN THE N-TERMINAL SECTION; BELONGS TO FAMILY 14 OF GLYCOSYL HYDROLASES (BETA-AMYLASES).
-: SIMILARITY: IN THE C-TERMINAL SECTION; BELONGS TO FAMILY 13 OF GLYCOSYL HYDROLASES, ALSO KNOWN AS THE ALPHA-AMYLASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       BY SIMILARITY.

SUBUNIT: MONOMER.

TISSUE SPECIFICITY: MOST ABUNDANT IN EMBRYO-DERIVED CALLUS TISSUE.
DEVELOPMENTAL STAGE: EXPRESSED AT A HIGH LEVEL DURING GERMINATION IN THE ALEURONES CELLES UNDER THE CONTROL OF THE PLANT HORMONE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                296 NLYNASNSGCYFDMRNILNGSVVQKHPIHAVT---FVDNHD-----SQPGEALESF 343
